

EA1368 Etere Backup VTR System

A system completely independent from automation, a simple system that can be used for any operator.

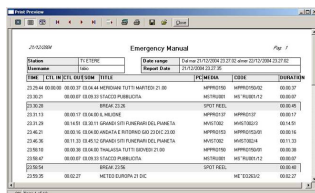

VTR

Backup VTR

Even in a fault tolerant environment a lot of stations require to have a backup VTR. The main reason is to be sure that a multiple fault in Automation or video server, or simply an operator fault, cannot stop the transmission.

Historically the VTR has a good reputation as a reliable system, and all the operators have a good confidence about it. Also the operators are expert in VTR manipulation.
