![Etere - a consistent system]

Etere makes XDCAM Proxy Browsing easier

The interoperability of the ETERE XDCAM Proxy means that it supports professional discs recorded in both HD and SD formats.

Platform of XDCAM

XDCAM

ETERE, the international leader in the broadcasting software market, makes browsing XDCAM proxy files that much quicker and easier.

Previously, in order to preview content held in the XDCAM Cart system, files would first need to go through the process of Transcoding. However, now all XDCAM proxy files are automatically held in the ETERE system making the browsing of said files much simpler and as there is no transfer time the preview process is much more efficient.

The interoperability of the ETERE XDCAM Proxy means that it supports professional discs recorded in both HD and SD formats. The XDCAM proxy is also integrated into ETERE Web, a user-friendly Web Browser that allows for real time information exchange and enhanced media asset visualization and management.

The XDCAM system provides both a flexible and practical archive solution. When high resolution media is ingested into the XDCAM cart system a low resolution or proxy file is automatically generated allowing for quick and easy browsing when supported by a suitable production system.

ETERE provides that system.
