

Etere: A Digital Media Workflow and Asset Management Solution for Post-Production houses

In the rapidly changing media industry, post-production houses are facing the need to improve their competitiveness by reducing content acquisition and distribution costs, improving asset management and automating the delivery of content across multiple targets.

Etere Player Graphics

Post-production houses need a flexible infrastructure able to rapidly accommodate to changes derived from increasingly complex video editing workflows. In this scenario, sharing information between systems and handling projects with several files are crucial challenges.

In this scenario, a digital media workflow and asset management solution is critically required to integrate multiple asset management tools, repositories and workflows into a single streamlined and automated file-based system able to significantly reduce costs and complexity while extending content acquisition and distribution across multiple environments.

Bundle Projects

EXPECTED BENEFITS

- **Flexibility**, to meet all requirements and handle all metadata and equipment managed internally and externally (customers and providers)
- **Scalability**, to increase complexity without altering the workflow, minimizing operational overheads and overall costs
- **Efficiency**, to reduce repetitive manual operations, allowing to define operations in advance within streamlined workflows
- **Reliability**, to use automatic workflows provided with detailed logs for tracking the overall and individual functioning of the system
- **Accuracy**, to reduce the risk of mistakes when archiving projects related to several files and introduce automatic and manual quality checks
- **Integration**, to bring straight access to the archive through a secure web interface available on non-linear editing systems
- **Security**, to grant operations based on specific user permissions depending on the structure of the an Active Directory domain
- **Usability**, to guarantee a smooth use and intuitive management of media content through a sophisticated graphical user interface

HSM Diagram

Solution

ETERE provides a workflow-based framework for all typical activities of Production Asset Management including scheduling and usage of mediums, assignment of physical production assets (editorial suites, storage media, drives or transports), extended management of elements for content assembly (original raw assets, proxies, versioning, protection, backup, and release masters).

Etere Fast QC

ETERE MERP is the revolutionary approach that unifies the entire spectrum of media asset management to store, manage and access digital files while ensuring the scalability, costeffectiveness and reliability of the global system. ETERE MERP is the cutting-edge framework to manages all production projects from their start to their finish, including promo creation, tape copying, media editing, subtitles generation, audio dubbing, and more.

Features

Etere Adobe Agenda and
Tasks

The Etere-based system will comprise media ingest, archive, management and distribution solution combining powerful modules with an easy to use interfaces. Etere's solution consists of a media archive system with acquisition, management and delivery capabilities of multipurpose media, it lies on a workflow-based framework able to cover the end-to-end archive management including ingest, storage, metadata, search, production and delivery.

CHARACTERISTICS

- Distributed architecture managed via workflow to avoid any single point of failure
- Enterprise management of digital content under a file-based environment
- Seamless integration with existing and co-existing systems
- Fast, safe and fully-tracked local/remote access to the content archive
- Enterprise management and transport of media between storage devices
- On-demand media transcoding to always deliver the correct media format
- Quality control to ensure the reliability of archived assets over short and long terms
- High preservation and high availability of archived and catalogued media content
- Browsing features including preview, slow-motion, time code, bookmarking and metadata
- Robust editing functions including video cut, merge, overlay and restore
- Best flexibility on digitizing media content from multiple sources
- Full integration support for NLE systems including archive upload/download
- Reliable monitoring of the modules and equipment integrated within the global system

ETERE is an integrated broadcasting solution that implements a modular system formed by a set of modules specifically oriented to cover each complex phase of a broadcasting system focusing to efficiently carry out specific operations such as ingest, archiving, transferring, browsing, etc. Modules typically included in a post-production system are listed below:

Modules

- **EtereWeb**, web-based access to view, preview, manage and download/upload assets
- **Etere Ingest**, flexible media acquisition from a wide range of sources including live feeds
- **Etere HSM**, automatic tape-based storage system for long-term storage management
- **Etere DataMover**, intelligent and fast transfer and transcoding between devices (SAS, NAS, etc.)
- **Etere Workflow**, automated management of assets and resources
- **Etere Player**, Browse hires and lowres files with advanced cataloguing capabilities
- **Etere CMS**, Automatic control of audio and video issues on stored media
- **Etere QC Integration**, Connect the most common QC solutions (e.g. Baton, Aurora, Cerify, etc.)
- **NLE Plugins**, straight archive access from Adobe Premiere and project archiving for Avid

BUNDLE PROJECTS

Etere supports bundle assets, special assets that contain other different assets and/or files referenced through a parent-child relationship:

- Bundle assets are managed through a special interface
- Bundle assets can contain multiple items (assets, files and directories)
- Bundle assets are stored maintaining a folder structure
- Bundle assets support uploading/downloading individual contained items
- Bundle assets can be managed using item-specific workflows
- Bundle assets are defined through a special property

STORAGE

Etere leverages their more than 24 years of experience in the broadcast and media management field to provide a fully comprehensive solution to ingest, archive and

use media, offering a single platform able to manage your assets with the maximum of flexibility and accuracy:

Media Ingest

Etere Ingest improves digitization inside a broadcasting system, it supports baseband and file-based acquisitions of parallel ingest streams, managed automatically by a single or multiple workstations:

Once ingested, video files are transcoded into the specific format of the destination device on which they will be stored, in the same way, video files are transcoded each time they are moved from one device to another (e.g.: archiving, delivery, etc.):

Automatic Archive/Restore

Etere HSM brings workflow-based archiving capabilities to ensure disaster recovery, continuity and shared management. Archiving operations can be performed via workflow, said workflows can be triggered either automatically at scheduled times or when specific conditions occurs (file arrives into a metadvice) or manually by an operator.

Etere HSM is the cost-effective solution to radically streamline the management of LTO tape libraries; optimizing offline/nearline storage including high and low versions as well as associated metadata:

Etere HSM distinguishes four different archiving levels into a broadcasting workflow, these levels require distinct access times which vary from 0 minutes (video server) to 15 minutes (standard video tapes). All these levels are managed “virtually”, that is, you can use logical devices (metadevices) based on physical devices to free design your storage layout, enriching in this way the entire system with the benefits derived from the use of metadevices:

- Perform loan-balanced transfers on an intelligent multi-volume scenario
- Extend your storage space by joining physical devices into one metadevice, without altering the archiving workflow
- Categorize your storage devices by dividing them into metadevices with no partitioning required
- Space limits and storage distribution are defined by the user and not by devices itself
- Classify metadevices in media pools in order to automate their management
- Background defragmentation and online/offline tape management,
- Scheduled archiving of devices, media contents and entire databases

Etere HSM forms a tandem with Etere Data Mover to be the only solution in the market with an embedded multi-level and multi-rule cache that offers an intelligent management which ensures the best performances with low investments.

Moreover, owing to Etere’s comprehensive character, these applications are perfectly integrated with other modules (e.g. Ingest, EtereWeb, etc.) to allow all these modules to use shared resources and have unlimited communication.

QUALITY CONTROL

Etere provides all the solutions required to control the quality of media files, including a built-in tool able to detect most common audio/video issues and a tight integration with industry’s most popular QC systems.

The execution of QC operations from within workflows allows taking specific decisions based on QC results; for instance, carrying out manual verifications in case issues are detected for a

certain media file:

QC results are automatically stored into the EDL of analyzed assets, thus allowing to consult encountered issues and create full reports:

QC results are automatically stored into the EDL of analyzed assets, thus allowing to consult encountered issues and create full reports:

Built-in Content Check

Etere CMS is the solution provided by Etere to accomplish Quality Controls (QC) requirements without using third-party systems. This tool can be easily included in media workflows to analyze media files (including MP4 and WMV proxies), automatically detect audio/video issues and write results directly into an asset EDL. Among the supported controls the following can be mentioned.

As shown in the figure above, Etere CMS can speed up, automate and streamline the operational efficiency of file-based quality controls performed via workflow across the entire content life cycle, it's the best solution for checking audio/video either prior (e.g. playout, repurpose, archiving) or after (e.g. encoding, ingest, editing, transcoding, archiving) a media operation.

Integrated QC Systems

Etere allows integrating third-party QC solutions to create custom workflow actions that request to an external system to analyze media files stored in the Etere cloud and return all detected issues (visual, audio or metadata). As mentioned before, results can be consulted in form of EDL segments and PDF reports or even used to automatically take decisions from within workflows:

The tight integration with third-party QC systems is based on SOAP API technology, which enables Etere to communicate through web services and exchange all QC related information:

CATALOGUING

Adding metadata is a quite important part of the workflow as it is crucial to enable retrieval of the available content in all other stages of the content lifecycle. Etere provides a comprehensive tool to allow users to quickly and easily enter metadata through a well-structured interface, empowered with browsing capabilities to preview Hires files (using Etere Player) and Lores files.

Metadata Insertion

In Etere, all assets contain user-defined metadata fields (e.g. technical comments, descriptive names, intellectual rights, etc.), these fields can be either manually compiled (by users) or automatically retrieved (from asset properties, files, etc.):

Metadata used across the system can be defined and organized into a robust dictionary, where metadata fields are freely added, modified and grouped into layouts enabled for specific users:

HiRes Browsing

Frame accuracy is crucial in post-production and in order to ensure a precise and reliable process, high resolution browsing and advanced audio functions can be considered as essential requirements.

Etere Player is a modern and very functional media player specifically designed to satisfy all current and forthcoming browsing challenges faced in broadcast, production, post-production and distribution companies. Etere Player doesn't miss any of the most important features needed by post-producers

to uphold audio controls with the highest quality, key capabilities include:

- Bullet-proof decoding of HiRes and LoRes
- Frame-accurate jog & shuttle
- Multi-language closed captions
- Multi-language audio tracks
- Embedded tracks and external audio files
- Built-in VU Meter display
- On-screen data (timecode, properties, etc.)
- Extensive encoding information display
- Multi-standard timecode (PAL, NTSC, HD50p, etc.)
- Native support for most common formats
- Improved support for MXF and LXF
- Contour Shuttle devices support

In order to fully leverage the full resolution of hires material, Etere Player supports using a second monitor to quickly switch the video stream playback:

Search

EtereWeb is a web service that supports all major browsers including Microsoft Internet Explorer, Mozilla Firefox and Apple Safari; thus ensuring the reliability and quality of the service. EtereWeb integrates the latest streaming technologies for video distribution and a comprehensive rights management system that gives to authorized users the possibility to access via web to a user-friendly interface:

Search for assets based on database fields,

- A Full-text search across various fields of assets
- Full-text results are sorted on degree of relevance
- Search for synonyms to extend the range of results
- Searches can be saved as profiles

Batch management of several assets at once,

- Customizable tabs and fields, drag & drop enabled,
- Results can be grouped by types, genres or artists,
- Add, launch and view workflows on-the-fly,
- Filter results by Metadata or Metadvice

Authenticated access and rights

In order to ensure that only authorized persons access the web service, EtereWeb counts with an encrypted authentication method on which users must count with a username and password in order to enter the web portal:

Search, retrieval and preview

The robust search engine of EtereWeb allows users to easily search and preview assets, even during the search. Search filters can be classified according to their nature into the following categories:

The Media tab holds information regarding the media associated to the asset, time code details and EDL configuration. By double clicking on any media item, if available, it will be available the preview and download of the asset:

Secure Download

EtereWeb allow not only to share the right files to the right persons but it also allows sharing contents

with the right permission levels; this capability is based on granting/denying function-specific permissions through Etere Worksheets, the module that allows web users to request temporary permission for specific functions (e.g. download a file linked to a certain asset):

Web requests are managed via workflow to allow a custom and automatic launch of worksheets:

Supervisors count with a dedicated interface for viewing pending requests and accept/deny them:

Once the requested is evaluated, web-users will automatically receive an email notification containing the information (e.g. ID, codec, fixed note and an evaluation note) about the asset for which the request has been performed. The email notification will be sent to the email specified in the personal data of the web-user who performed the request, this, depending on the entity type:

Finally, in case the request is accepted, the web-user will be now allowed to download the requested file(s) through EtereWeb:

Multi-file upload

EtereWeb allows uploading media files into the server through a simple and intuitive wizard procedure:

EtereWeb supports not only uploading multiple files with a simple drag and drop action, but also manage them as a single project. This feature allows NLE systems to, for example, upload into the facility server all the files which make part of a project (e.g. production of promos, conforming of separate scenes, editing of source material, etc.) and deliver them to the related department with a single click and with the reliability of a workflow management:

3.5.5. Pre/Post upload processing

EtereWeb allows setting different workflows to be launched at different stages of the web management, for example, it is possible to configure the following workflows:

- Pre-upload workflow
- Post-upload workflows

Centralized monitoring interface

EtereWeb provides administrators with two key sections from which they will be able to consult:

- Login Report : Detailed information about user-specific accesses
- User Statistics : Overall information about daily and weekly accesses

DELIVERY

Edited content can be delivered through the simple execution of a workflow:

Etere Data Mover is a solution proposed to encompass content transfer and archiving goes beyond of a simple copy concept by moving video files based on custom policies, transcoding video files when required and offering a full track of all operations.

EDT protocol

EDT (Etere Data Transfer) is a technology developed by Etere based on the high-performance data transfer protocol UDT (UDP-based Data Transfer), it uses a streamlined algorithm capable to utilize all the available WAN bandwidth, making of it the ideal solution for data intensive transfers over high speed wide area networks (it's 7 times faster than FTP).

Etere EDT is included in the Etere FTP server for custom and faster FTP transfers, providing a wide set of parameters (e.g. enabled users, EDT range, etc.) and a detailed log of operations and connected users:

Third-party integration

Etere provides tight integration with major transfer solutions such as Signiant and Aspera, supporting transfers based on standard protocols including FTP, SFTP, SMB and CIFS. In this chapter is illustrated the tight integration of Etere with Signiant, allowing to trigger jobs and get updates of progress and status information. Custom "Signiant integration" workflow actions allows requesting -via workflow- the execution of file transfers based on Signiant jobs for files stored in

Etere.

Checksum verification

Etere offers an enterprise control of video files integrity; it keeps a log of the hash MD5 of video files such in a way that it is possible to verify at any time if they have been modified after their approval.

All video files registered on the Etere's database can be verified through an md5 checksum, this control is performed via workflow, each time that a video file is moved from one device to another, its initial hash MD5 is calculated to allow a future checking: The workflow editor allows creating custom checksum workflows to either generate or check the MD5 hash of a video file:

Integrated transcoding

Etere's integration with Carbon Coder software handles a wide array of critical operations, including format conversions that ensures content is always stored in the right place in the right format:

Etere provides multiple ways to use Carbon Coder within workflows, you can use Carbon presets as well as complex projects.

NLE PLUGINS

For a more tight integration with major NLE systems, Etere provides specific features for Avid and Adobe Premiere systems:

Adobe Integration

The Compliance operations for content performed using Adobe Premiere ® Pro will be integrated into Etere MAM, empowering authenticated users to interactively run faster video editing from the Etere archive across virtually any network. Our Adobe Premiere extension will give Editing operators with a user-friendly interface to view their assigned tasks, select and take the one to be imported:

Once editing is finished, final media will be automatically rendered based on a preset EPR profile (e.g. DV25 MOV 4 Tracks), then, it will be uploaded into the Etere archive. Once media is uploaded into the archive the task is set as completed and the workflow continue its execution (e.g. notifying availability of the edited version and starting a QC).

It's worth mentioning that asset versions uploaded during editing process will be managed using the

Etere's versioning standard, maintaining a parent-child relationship with the master.

AVID integration

Etere provides the ultimate solution for broadcasters, production and post-production houses to preserve editing projects while optimizing ISIS storage utilization and adding contemporary archive storage technologies.

ETERE provides a simple but powerful toolset able to enrich any AVID editing system with all the major features of its world-class Media Asset Management system, enabling users to archive and restore AVID projects together with all their associated media in any storage location and transfer projects in the cloud.

ETERE enables users to easily archive NewsCutter and Media Composer projects and either free-up

editing storage space, keep backup copies or create version snapshots.

- Key set of features to ensure an effective storage management:
- Archive from any pc with access to projects and media
- Restore to original workspace or any location
- Automatic update of project's media and metadata
- MD5 checksums to ensure bit for bit identical copies
- Partial restore of sequences and master clips
- Low-cost LTO and ODA are used to extend ISIS servers
- Accurate reports on archive completion status projects in the cloud
