An all-new cloud-ready solution that allows significant time savings in QC tasks is being unveiled in Hall 8. Etere Advanced QC is offered as
part of Etere MAM at no additional cost.

This latest release is built with an integrated modular architecture designed to perform comprehensive QC. The video quality check software system is able to analyse an expansive list of file formats, including support for all major wrappers and all compression schemas.

Etere Advanced QC is cloud-ready and is able to automatically detect and mark audio/video issues such as freeze frames, black frames, scene changes, audio loss, video block, video blur, luminance line errors, chrominance line errors, audio clipping, scene cut detection, luminance headroom violations, chroma headroom violations and more.

In addition, the software has the capacity to deliver analysis from live sources. It also comes with clustering and easy load balancing, and is capable of supporting simultaneous multi-users, multi-formats, multi-level reporting environments, multi-parameter analysis and parallel analysis of multiple and simultaneous sources.
